

Modeling P2P protocols by cellular automata

Gábor Balázsfalvi,
János Sztrik

Debrecen University
Faculty of Informatics

7th International Conference on Applied Informatics
January 28 – 31th, 2007
Eger, Hungary

Outline

- 1 P2P networks
 - Concept of P2P networks
 - Use of P2P networks
 - Protocols to model
- 2 P2P modeling technics
 - Stochastic modeling
 - Discrete event simulation
- 3 Cellular automata
 - Definition
 - Neighborhoods
- 4 Examples
 - Message delivery
 - Synchronization
 - BitTorrent simulation
- 5 Main bibliography

Concept of P2P networks

- Peer-to-peer means the overlay type: the peers are interconnected.
- A peer-to-peer network breaks up with the tradition of using client/server architecture.
- No dedicated network is needed, simple internet connection per peer is used instead.
- Peers interconnect in an ad-hoc manner.
- Use of decentralized distributed algorithms.

Concept of P2P networks

Use of P2P networks

- This approach makes us possible to use modern chat-voice-video clients.
 - Microsoft Live (MSN) Messenger.
 - Skype.
 - Yahoo Messenger.
 - VoIP telephony also.
- Also widely used in file-sharing systems.
 - BitTorrent.
 - UseNext.

Protocols to model

- Synchronization protocols.
- Hash table protocols.
- Content sharing protocols.
- Replication protocols.

Protocols to model

Protocols to model

- Synchronization protocols.
- Hash table protocols.
- Content sharing protocols.
- Replication protocols.

Stochastic modeling

- Benefits
 - Mathematically clear.
 - Tools/results are given.
 - Computer aided.
- Drawbacks
 - Overgeneralization.
 - Too much simplification.
 - Some protocols do not fit.

Stochastic modeling

- Benefits
 - Mathematically clear.
 - Tools/results are given.
 - Computer aided.
- Drawbacks
 - Overgeneralization.
 - Too much simplification.
 - Some protocols do not fit.

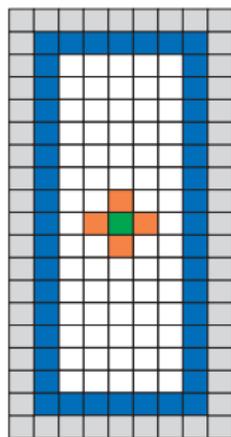

Discrete event simulation

- Benefits
 - Every creatable protocol can be modeled.
 - Any kind of parameter is measurable.
 - Even repeatable.
- Drawbacks
 - Bad design of the simulation tool can cause problems.
 - Simulation time usually very long.
 - Sometimes we cannot be sure about approaching the steady-state.

Discrete event simulation

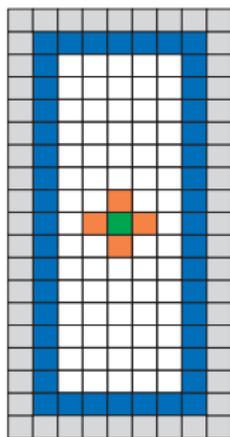

- Benefits
 - Every creatable protocol can be modeled.
 - Any kind of parameter is measurable.
 - Even repeatable.
- Drawbacks
 - Bad design of the simulation tool can cause problems.
 - Simulation time usually very long.
 - Sometimes we cannot be sure about approaching the steady-state.

Definition

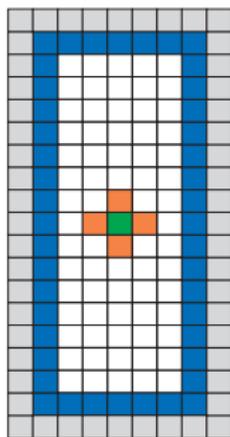

- We put a copy of a deterministic finite automaton (DFA) into each cell of a finite closed area of the \mathbb{Z}^n space.
- This DFA has a state transition function depending on the state of the cell's neighbors as well.
- Special neighborhoods are used.
- From outside, the system is not touchable.

- From outside, the system is not touchable.

Neighborhoods

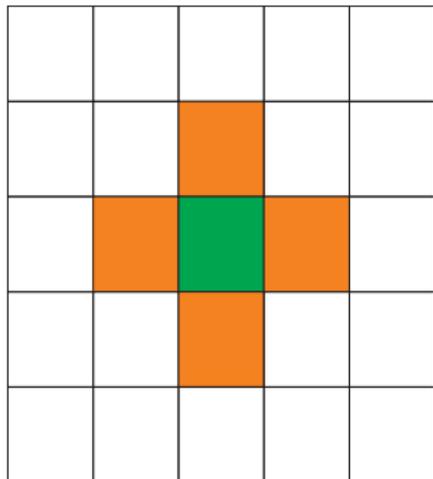

- Arbitrary composition.
- Moore neighborhood.
- Von Neumann neighborhood.
- Von Neumann in one dimension.

Neighborhoods
